 ure various Transcription factor. Interacts specifically with the W PUNCTION: Transcription factor. Interacts specifically with the W box (5'-(T)TGAC(C/T)-3'), a frequently occurring elicitor-responsive cis-acting element (By similarity).
SUBCELLULAR LOCATION: Nuclear (Probable).
SIMILARITY: Belongs to the WRKY group I family.
SIMILARITY: Contains 2 WRKY domains.

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAB86066-A80623 encode the 12 secreted protein sequences given in AAB8556-B25993. The human secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant; anti-inflammatory; antiarthritic; antizheumatic; dermatchlogical; antiproliferative; and antifungal activity. The proteins, polypeptides, agonists and antifungal activity. The proteins, polypeptides, agonists and antigual activity. The proteins, polypeptides, agonists and conditions examples of which include: immune disease, disorders and conditions examples of which include: immune disease, addison's disease and nephritis; dermatitis, and multiple sclerosis; inflammatory disorders e.g. inflammatory bowel disease, crohn's disease and nephritis; hyperproliferative disorders e.g. coronary arteriosclerosis and myocarditis; cancer e.g. melanoma and lymphoma. The proteins and polymucleotide sequences may also be used in wound healing proteins and polymucleotide sequences may also be used in wound healing and protein sequences are represented in sequences AAAB0616 and AAB2566 Sequences AAAB0677-AB0682 represent genes related to the
 Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, ameliaration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer, wounds, and infectious diseases.

 (HCSRP) designated HCSRP-8. The nucleotide sequence was identified in Incyte Clone 312256 from the CDNA library LUNGNTO2, which was made from RNA isolated from lung tissue. A number of Incyte Clones were used to assemble the consensus sequence. BLAST analysis showed that the sequence is homologous to immuno-superfamily protein B12 g3779242. HCSRP and its antagonist are useful for preventing or treating disorders associated with decreased or increased expression or activity of HCSRP. Such disorders include cancers such as leukaemia and melanoma, immune disorders uch as rheumatoid arthritis, asthma and atherosclerosis, bacterial and parasitic infections and neuronal disorders such as akathesia. Alzheimer's disease, multiple sclerosis and epilepsy. Polynucleotides encoding HSCRPs may be used as hybridisation probes to diagnose these conditions. Anti-HCSRP antibodies may be used as

The present amino acid sequence is the human lymphoid derived dendritic cell adhesion molecule, iDCAM. It is found on lymphoid derived dendritic cells and displays homology to adhesion molecules, B7-1 and cytoplasmic region of B7-Li. Human LDCAM is expressed in breast, retina, foetal carcinoma. LDCAM polypeptides interacts with T cell surface molecules to carcinoma. LDCAM polypeptides interacts with T cell surface molecules to carcinoma. LDCAM binding protein and increases natural killer (NK) cell populations. IT may be used to measure the biological activity and as quality control reagents of LDCAM binding proteins. LDCAM may be used for treating disorders associated with malfunctioning of immune system, cinflammation, autoimmune disorders, viral infected cells, infectious diseases and for killing tumour cells. They are also useful for companient or reducing the effect of organ and bone marrow transplant crejection and for modulating T cell immune responses. LDCAM polypeptides may also be used as carriers for delivering agents attached to T cells or cells bearing B7L-1

The invention relates to an isolated polynucleotide (I) comprising one of 245 sequences (ABQ93288-ABQ9332). Treating a condition comprising administering to a mammalian subject a composition comprising the protein (II) encoded by (I) (ABP62809-ABP63053) or an antibody (III) to (II).

(I) is useful for gene therapy of diseases and (III) can be used for therapeutic treatment. Diseases that may be treated include wound healing and tissue repair, burns, central nervous system disorders (e.g. Alzheimer's Parkinson's, Huntington's and amylotrophic lateral sclerosis, immune deficiencies, cancer, autoimmune disorders, multiple sclerosis, diabetes and allergies. Note: The sequence data for this patent din not form part of the printed specification, but was obtained fit wipo.int/pub/published_pot_sequences

 The invention relates to a method for detecting cell proliferative disorder associated with tumour suppressor lung cancer 1 (TSLC1) in a subject. The method comprising contacting a cell component of a proliferating cell with a reagent that detects level of the cell component in the proliferating cell and determining modification in the component in proliferating cell as compared with a healthy cell, where modification indicates disorder associated with TSLC1. The method is useful for detecting a cell proliferative disorder cencer lung or pancreatic cancer) associated with tumour suppressor lung cancer 1 (TSLC1) in a subject. The invention is useful in gene therapy and for treating a cell proliferative disorder sund as lung cancer (human non-small cell lung cancer), liver cancer (heptocellular carcinoma) or pancreatic cancer associated with modification of TSLC1 production, where a reagent which modulates (preferably, increases) TSLC1 level in the cells, is employed. The present sequence is human TSLC1

The invention relates to an isolated nucleic molecule that is at least CC 594 identical to 18 human cDNA sequences representing 12 novel genes encoding secreted proteins or a polymuclectide fragment of the CDNA.

CC defined in the specification, its species homologue, a variant or allelic variant of the polymuclectide having a longuage capable of the CDNA.

CC defined in the specification, its species homologue, a variant or allelic variant of the polymuclectide having a longuage under stringent conditions to a undele cade molecule of the polymuclectide sequence of only A or T residues. Also included are recombinant vectors, host cells (for producing the polymeptide), the secreted polypeptide fragment, domain, epitope, full-length protein, variant, allelic variant or species homologue), antibodies that protein, variant, allelic variant or species homologue), antibodies that protein, variant, allelic variant or species homologue), antibodies that protein, variant, allelic variant or species homologue), preventing or ameliorating a medical condition by administering the polymentide corresponding to the cDNA sequence and activity in a biological assay (by expressing the CDNA sequence in a cell, isolating the supernatant, and detecting an activity in a biological assay (by expressing the CDNA sequence in a cell, isolating the supernatant, and detecting an activity in a biological assay (by expressing the CDNA sequence in a cell, isolating the supernatant, and detecting an activity in a biological assay (by expressing the CCC dentifying an activity, in a biological and antibodies are used to a susceptibility to a pathological condition, such as cancer, inflammation and other immune disorders, neurological and blood clotting disorders (many examples are estriction mapping). The polypeptides and antibodies are also are also useful for thromosome identification, radiation hybrid mapping or long-range restriction mapping) The polypeptides are longued as a foot additive or or preventing invariant or negonist may also be
 New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting

 The invention discloses a composition comprising two or more isolated rate or human polymucleotides or a polymucleotide which represents a fragment, or human polymucleotides or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the polypeptides given in the contivity in an animal of one or more of the polypeptides given in the contivity in an animal of one or more of the polypeptides given in the contivity in an animal of one or more of the polypeptides given in the contivity in a method for identifying a compound useful in treating and a pecification, a method for identifying a compound useful in treating and a pecification and animal or more of the polypeptides given in the continual and animal or more of the polypeptides given in the continual and animal continual and animal commonities of the polypeptides given in the continual and animal continual and animal commonities and animal continual animal animal c

pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CGI) and spared nerve injury (SII) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 transmembrane proteins used therapeutically. The PRO proteins have evytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polymuclectides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses

New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptors/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources

detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNP) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation of differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also breast, prostate, rectal, cervical, or liver tumours, and also breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders

 New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes.
 The invention relates to an isolated PRO polypeptide (a secreted or transmembrane protein) comprising: (a) at least 80% sequence identity or positives when compared to any of 15 sequences, fully defined in the specification, lacking or with its associated signal peptide, or least 80% sequence identity to a sequence encoded by the full-length coding sequence of a DNA deposited in the American Type Culture Collection (ATCC). Also included are: (1) an isolated nucleic acid comprising: (a) at least 80% sequence identity to a nucleotide sequence that encodes a PRO protein; (b) at least 80% sequence identity to a

The PRO polypeptide or polynuclectide is useful in pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atherosclerosis, cardiac injury, infercility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS) and diabetic complications in mammals, e.g. humans, dogs,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New secreted and transmembrane polypeptides (e.g. PRO241, for use in pharmaceuticals, diagnostics or bioreactors, particularly for detecting or treating e.g. cancers, infertility or acquired immunodeficiency syndrome in mammals.
             industry; cytostatic; antiinflammatory; cardiant; antiinfertility; anti-HIV; antiarteriosclerotic; antidiabetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eaton DL, Ferrara N, Filvaroff E;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   YMLYVYDPPTTIPPPTTTTTTTTTTTTTTTTTTTTTTSRAGEEGSIRAVDHAVIGGVVAVVV 385
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO bolypeptide and a method for detecting the presence of tumour in a mammal. The polypeptides and polymucleotides are useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. Sequences ABUBSSPR-ABUBSBRS represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at segdata.uspto.gov/sequence.html

WPI; 2003-332034/31. N-PSDB; ACA73401. Three hundred and five nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, and for detecting the presence of tumor in a mammal.

Claim 11; Fig 34; 707pp; English.

The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane), sequences 80% identical to them, or encoding a PRO polypeptide lacking its associated signal peptide or an extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide. Also included are the encoded PRO proteins, PRO expression vectors, host cells transformed with the vector (used to

                                                                                                                                                                                                                                                  -NON-90
         produce PRO proteins), a chimaeric molecule comprising the PRO
polypeptide fused to a heterologous amino acid sequence, an anti-PRO
artibody, a method for stimulating the ralease of tumor necrosais factor
alpha (TNR-alpha) from human blood (by contacting the blood with PRO1079,
PRO827, PRO791, PRO1131, PRO1316, PRO1183, PRO1343, PRO1760, PRO1567 or
PRO4331), a method for stimulating the proliferation or differentiation
of chondrocyte cells by contacting the cells with a PRO6029 polypeptide,
a method for detecting the presence of tumour in a mammal and an
oligomucleotide probe darived from any of the nucleotide sequences cited
above. The PRO polypeptide or anti-PRO antibody is useful for preparing a
medicament for treating a condition that is responsive to the PRO
polypeptide or anti-PRO antibody. The PRO nucleotide sequences are useful
complements of the presence of a transgenic animals or knockout
antisense RNA and DNA. PRO nucleic acids are also useful in preparing procypeptides, in assays to identify other proteins or molecules involved
animals, which in turn are useful in the development and screening of
therapeutically useful reagence from numeric acid molecules are also
useful for detecting the presence of a tumour in a mammal, simulating
proliferation or differentiation of chondrocyte cells, stimulating
curlease of tumour necrosis factor-alpha from human blood, in gene
purposes. The anti-PRO antibodies may be used in diagnostic assays for
PRO, or for the affinity purification of PRO from recombinant cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ransmembrane (PRO) polypeptides. Also disclosed is a antibody that specifically binds to the PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TWF-alpha) from human blood by contacting the blood a PRO polypeptide, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the presence of a tumour in a mammal and an oligonucleotide probe derived from any of the PRO nucleotide sequences. The nucleotide sequences are useful as probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as molecular weight maxkers for protein electrophoresis purposes, for for stimulating the release of TWR-alpha from human blood, for stimulating the presence of a tumour. The PRO polypeptides and cetecting the presence of a tumour. The PRO polypeptides and cetecting the presence of a tumour. The PRO polypeptides and cetecting the presence of a tumour. The PRO polypeptides and cetection acids may also be used diagnostically for tissue typing. The sequences presented in ABU67406-ABU67710 are the PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                145

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Three hundred and five nucleic acids encoding secreted and transmembrane RNO polypeptides, useful for the diagnosis, prevention and/or treatment of tumors, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumors.
                                                                                                                                                                                                                                                                                                                      The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane). Methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of tumours, such as defaulated, colon, breast, prostate, rectal, cervical or liver tumours. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human CDNA, genomic DNA or mRNA. The PRO genes are also be used in gene therapy, particularly for replacing a defective gene. The present sequence represents a human PRO polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     83

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human PRO secreted/transmembrane polypeptides (ABR78227-ABR78531) and nucleic acids encoding them (ACF00100-00404). The invention also relates to sequences at least 80% identical to the PRO nucleic acid had polypeptide sequences of the invention, recombinant vectors and host cells comprising a PRO nucleic acid, a method for the recombinant production of a PRO polypeptide, antibodies against a PRO polypeptide, and fusion proteins comprising a PRO polypeptide. Nucleic acids encoding PRO polypeptides of the invention were initially identified via homology screening using consensus sequences based on the extracellular domain sequences from known secreted proteins. Human cDNA libraries containing sequences of interest were identified using oligonucleotides based on the consensus sequences, and cDNA clones were isolated and characterised. The PRO polypeptides are useful for
                                                                                                                              442
                                                                                                                                                                                                                                                                                                                                                                               extracellular domain, tumour necrosis factor-alpha; TNF-alpha; chondrocyte; proliferation; differentiation; cartilage disorder; bone disorder; arthritis; sports injury; cancer; tumour; diagnosis; adrenal tumour; lung; colon; breast; prostate; kidney; rectum; cervix; liver; drug screening; transgenic animal; genetic analysis; antiarthritic; vulnerary; gene therapy.

the continuating release of tumour necrosis factor-alpha (TNF-alpha) from human blood and may thus be used in the treatment of conditions in which cannated TNF-alpha release would be beneficial. They are also useful for stimulating the proliferation or differentiation of chondrocytes and as conditional to the treatment of various bone and/or cartilage disorders such as arthritis and sports injuries. The RDO polypeptides may be used in the treatment of various bone and/or cartilage consend it method for detecting the presence of a tumour. Proseste tumour, rectal tumour, cervical tumour or liver tumour, proseste conforted tumour, cervical tumour or liver tumour, proseste in test and control samples, where a higher level of expression of PRO polypeptide in the test sample as compared to the control sample is inclicative of the presence of a tumour. The PRO polypeptides are additionally useful for in drug screening to identify agonists and antagonists of PRO polypeptides are useful as higher latengation probes (for isolation of cDNA molecules), in chromosome and controlisation probes (for isolation of cDNA molecules), in chromosome and controlisation probes (for isolation of cDNA molecules), in chromosome and controlisation probes (for isolation also be used for mapping genes encoding PRO polypeptides, for generation of antisense RNA and DNA and in gene therapy. The nucleic acids can also be used for mapping genes encoding PRO polypeptides, for generation of streams and screening of the rangelly useful compounds. Sequences ABRY8227-ABR78531 represent the human PRO secreted/transmembrane polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format the form to prove the properties of the properties of the provence of the properties of the provence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   145

δ 원 à 요 Claim 12; Fig 24; 172pp; English.

The invention relates to an isolated nucleic acid encoding a secreted/ transmembrane polypeptide (designated as PRO proteins). 15 PRO polypeptides and their encoding polymucleotides are disclosed. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, a process for producing a PRO polypeptide (by culturing the host cell under conditions for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the cell culture, an isolated polypeptide having at least 80% amino acid sequence identity to the PRO polypeptides, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence and an antibody which specifically binds

        in chromosome and gene mapping, in generating sense and antisense FNA or the development and screening of therapingally useful reagents, and in gene therapy. The polypetides may be used as molecular weight markers for protein electrophoresis purposes. The PRO polypeptides and nucleic acids may also be used for chromosome identification, and tissue typing. PRO24! (identified as Chordin) is a candidate gene for cornella de Lange syndrome. Other PRO proteins are variously implicated in immune disorders, inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, cardiac injury, ALDS, cancer and diabetic complications. The present sequence represents

The methods a compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This is the amino acid sequence of a novel human secreted PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FRDFRPLKDSRFQLLNFSSSELKVSLTNVSISDEGRYFCQLYTDPPQESYTTITVLVPPR

v secreted and transmembrane PRO polypeptides and nucleic acids, useful gene therapy, chromosome identification, tissue typing, for detecting presence of tumor in a mammal, or as hybridization probes in gene mapping the 5

Claim 11; Fig 34; 707pp; English

The invention describes a novel isolated PRO polypeptide. The PRO polypeptide or anti-PRO antibody is useful for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody. The PRO nucleotide sequences are useful as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically

```
useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful for detecting the presence of tumour in a mammal, stimulating proliferation or differentiation of chondrocyte cells, stimulating the release of tumour necrosis factor-alpha from human blood, in gene therapy, or as molecular weight markers for protein electrophoresis purposes. The anti-PRO purification of PRO from recombinant cell culture or for the affinity purification of PRO from recombinant cell culture or natural sources. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                               205

This invention relates to a nucleotide sequence encoding an isolated secreted and/or transmembrane protein. The nucleotide sequences of the invention may have antiinflammatory, antiarteriosclerotic, cardiant, anti-infertility, anti-HIV, cytostatic and antidiabetic activities and may be used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   264 TCEAIGKPQPVMVTWVRVDDEMPQHAVLSGPNLFINNLNKTDNGTYRCEASNIVGKAHSD 323

The invention discloses human nucleic acids encoding secreted and transmembrane (PRO) polypeptides, with or without their associated signal corrections and sclosed is an antibody that specifically binds to the PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNR-alpha) from human blood by contacting the blood with a Cifferentiation of chondrocyte cells by contacting the blood with a RRO polypeptide, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide, a method for detecting the presence of a tumour in a mammal an onligonucleotide sequences are useful as probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as molecular weight markers for protein electrophoresis purposes, for chromosome identification, as chromosome markers, as therapeutic agents, for stimulating the presence of TNF-alpha from human blood, for stimulating the presence, prevention and/or treatment of a tumour, such as detecting the presence, prevention and/or treatment of a tumour, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumour. The PRO polypeptides and nucleic acids may also be used disapnostically contribution. Note: The sequence data for this patent can also be betained contribution.

"The PRO polypeptides and nucleic acids may also be obtained contribution of contribution of charactined in a PRO polypeptide."

"The PRO polypeptides and nucleic acids may also be used disapnostically contribution. Note: The sequence data for this patent can also be betained."

"The PRO polypeptides and nucleic acids may also be obtained contribution."
